This file specifies files that are _not_ uploaded to Google Cloud

using gcloud. It follows the same syntax as .gitignore, with the addition of

"#!include" directives (which insert the entries of the given .gitignore-style

file at that point).

#

For more information, run:

\$ gcloud topic gcloudignore

#

.gcloudignore

If you would like to upload your .git directory, .gitignore file or files

Here the instructions define your application as a service called "server".

This service is built from the Dockerfile in the current directory.

You can add other services your application may depend on here, such as a

database or a cache. For examples, see the Awesome Compose repository:

# The commented out section below is an example of how to define a PostgreSQL
# database that your application can use. `depends_on` tells Docker Compose to

Building and running your application

When you're ready, start your application by running:

```
`docker compose up --build`.
```

Your application will be available at <http://localhost:4000>.

Deploying your application to the cloud

First, build your image, e.g.: ``docker build -t myapp`.``

If your cloud uses a different CPU architecture than your development machine (e.g., you are on a Mac M1 and your cloud provider is amd64), you'll want to build the image for that platform, e.g.:

```
`docker build --platform=linux/amd64 -t myapp`.`
```

Then, push it to your registry, e.g. ``docker push myregistry.com/myapp`.``

Consult Docker's [getting started](<https://docs.docker.com/go/get-started-sharing/>) docs for more detail on building and pushing.

hephaestus_api

The backend API for Hephaestus.

DB

We are using PostgreSQL for the Database.

To connect use the database name: "postgresql".

To connect we need to run the `downloadPrivateKeyFromGSM.py` script to download the `private_key.pem` file to decrypt the password.

This requires the Google SDK to be setup as it uses the Google Secrets Manager to download the file securely.

Google SDK

We need to authenticate with the Google SDK with this command

`gcloud auth application-default login`.

Kubernetes Config

The Ansible script uses the Kubernetes configuration that is created by

Terraform to run you can get this saved to your local `.kube/config`

file by running the command `gcloud container clusters get-credentials \$(terraform output -raw cluster_name)`. The Terraform script updates the contents of `.kubeconfig` with this file. The Terraform

outputs `_should_` be doing this but they don't seem to be working for some reason.

To keep billing low, let's only use Terraform clusters in bursts. We have to pay for having the cluster running so let's just run ``terraform destroy`` anytime we aren't actively testing stuff.

Docker Config

The Ansible ``deploy_app.yml`` script requires that Docker is authenticated with GCloud with ``gcloud auth configure-docker``.

Cloud SQL Proxy

To connect to the Cloud SQL Database from your local machine you can use the Cloud SQL Proxy simply download it from <https://github.com/GoogleCloudPlatform/cloud-sql-proxy> and run it.

First you need to authenticate with ``gcloud auth application-default login`` then you need to run it with ``.\\cloud-sql-proxy.exe hephaestus-418809:us-west1:hephaestus-postgres``

You can also run it using docker with this command:

```
```docker run --rm --network=host gcr.io/cloud-sql-connectors/cloud-sql-proxy:2.6.1 --address 0.0.0.0 --port 5432 --database-uri postgres://username:password@cloudsqlip:5432/dbname
...
```
```

or this one

```
```docker run --rm --network=host gcr.io/cloud-sql-connectors/cloud-sql-proxy:2.6.1 --address 0.0.0.0 --port
```

```
```

#!/bin/sh

#

An example hook script to check the commit log message.

Called by "git commit" with one argument, the name of the file

that has the commit message. The hook should exit with non-zero

status after issuing an appropriate message if it wants to stop the

commit. The hook is allowed to edit the commit message file.

#

To enable this hook, rename this file to "commit-msg".

Uncomment the below to add a Signed-off-by line to the message.

Doing this in a hook is a bad idea in general, but the prepare-commit-msg

hook is more suited to it.

#

SOB=\$(git var GIT_AUTHOR_IDENT | sed -n 's/^(.*> \).*/Signed-off-by: \1/p')

grep -qs "^\$SOB" "\$1" || echo "\$SOB" >> "\$1"

This example catches duplicate Signed-off-by lines.

echo >&2 Duplicate Signed-off-by lines.

<<\DOC_END

```

This sample hook safeguards topic branches that have been published from being rewound.

The workflow assumed here is:

- * Once a topic branch forks from "master", "master" is never merged into it again (either directly or indirectly).
- * Once a topic branch is fully cooked and merged into "master", it is deleted. If you need to build on top of it to correct earlier mistakes, a new topic branch is created by forking at the tip of the "master". This is not strictly necessary, but it makes it easier to keep your history simple.
- * Whenever you need to test or publish your changes to topic

branches, merge them into "next" branch.

The script, being an example, hardcodes the publish branch name to be "next", but it is trivial to make it configurable via \$GIT_DIR/config mechanism.

With this workflow, you would want to know:

(1) ... if a topic branch has ever been merged to "next". Young topic branches can have stupid mistakes you would rather clean up before publishing, and things that have not been merged into other branches can be easily rebased without affecting other people. But once it is published, you would not want to rewind it.

(2) ... if a topic branch has been fully merged to "master".

Then you can delete it. More importantly, you should not build on top of it -- other people may already want to change things related to the topic as patches against your "master", so if you need further changes, it is better to fork the topic (perhaps with the same name) afresh from the tip of "master".

Let's look at this example:

o---o---o---o---o---o---o---o---o "next"
/ / / /

```

/ a---a---b A / /
/ / / /
/ / c---c---c---c B /
/ / / \ /
/ / / b---b C \ /
/ / / / \ /
---o---o---o---o---o---o---o---o---o---o "master"

```

A, B and C are topic branches.

- * A has one fix since it was merged up to "next".
- * B has finished. It has been fully merged up to "master" and "next",
and is ready to be deleted.
- * C has not merged to "next" at all.

We would want to allow C to be rebased, refuse A, and encourage
B to be deleted.

To compute (1):

```

git rev-list ^master ^topic next
git rev-list ^master      next

```

if these match, topic has not merged in next at all.

To compute (2):

```
git rev-list master..topic
```

if this is empty, it is fully merged to "master".

#

An example hook script to prepare the commit log message.

Called by "git commit" with the name of the file that has the

commit message, followed by the description of the commit

message's source. The hook's purpose is to edit the commit

message file. If the hook fails with a non-zero status,

the commit is aborted.

#

To enable this hook, rename this file to "prepare-commit-msg".

This hook includes three examples. The first one removes the

"# Please enter the commit message..." help message.

#

The second includes the output of "git diff --name-status -r"

into the message, just before the "git status" output. It is

commented because it doesn't cope with --amend or with squashed

commits.

The third example adds a Signed-off-by line to the message, that can

still be edited. This is rarely a good idea.

C:\Users\david/src\hephaestus-api\.git\hooks\push-to-checkout.sample

#!/bin/sh

An example hook script to update a checked-out tree on a git push.

#

This hook is invoked by git-receive-pack(1) when it reacts to git

push and updates reference(s) in its repository, and when the push

tries to update the branch that is currently checked out and the

receive.denyCurrentBranch configuration variable is set to

updateInstead.

#

By default, such a push is refused if the working tree and the index

of the remote repository has any difference from the currently

checked out commit; when both the working tree and the index match

the current commit, they are updated to match the newly pushed tip

of the branch. This hook is to be used to override the default

behaviour; however the code below reimplements the default behaviour

as a starting point for convenient modification.

#

The hook receives the commit with which the tip of the current

branch is going to be updated:

commit=\$1

It can exit with a non-zero status to refuse the push (when it does

so, it must not modify the index or the working tree).

die () {

echo >&2 "\$@"

```
exit 1
```

```
}
```

```
# Or it can make any necessary changes to the working tree and to the
```

```
# index to bring them to the desired state when the tip of the current
```

```
# branch is updated to the new commit, and exit with a zero status.
```

```
#
```

```
# For example, the hook can simply run git read-tree -u -m HEAD "$1"
```

```
# in order to emulate git fetch that is run in the reverse direction
```

```
# with git push, as the two-tree form of git read-tree -u -m is
```

```
# essentially the same as git switch or git checkout that switches
```

```
# branches while keeping the local changes in the working tree that do
```

```
# not interfere with the difference between the branches.
```

```
# The below is a more-or-less exact translation to shell of the C code
```

```
# for the default behaviour for git's push-to-checkout hook defined in
```

```
# the push_to_deploy() function in builtin/receive-pack.c.
```

```
#
```

```
# Note that the hook will be executed from the repository directory,
```

```
# not from the working tree, so if you want to perform operations on
```

```
# the working tree, you will have to adapt your code accordingly, e.g.
```

```
# by adding "cd .." or using relative paths.
