C:\Users\david/src/hephaestus\README.md

hephaestus

An app that connects people with shared hobbies.

Setup

To get things working you need to set the `serverIp` variable in `App.tsx` to your computer's ip address. Furthermore, this must be on the same WiFi network as your phone.

Provisioning the development environment

Dependencies:

- Node.js
- React
- React Native
- Typescript
- [*See the full list of JS packages here*](package.json)
- **macOS specific**
 - Xcode
 - Watchman
 - CocoaPods

See [PROVISIONING](doc/PROVISIONING.md) for detailed setup instructions.

appropriate message if it wants to stop the commit. The hook is

allowed to edit the commit message file.

C:\Users\david/src/hephaestus\.git\hooks\commit-msg.sample

#!/bin/sh

#

An example hook script to check the commit log message.

Called by "git commit" with one argument, the name of the file

that has the commit message. The hook should exit with non-zero

status after issuing an appropriate message if it wants to stop the

commit. The hook is allowed to edit the commit message file.

#

To enable this hook, rename this file to "commit-msg".

Uncomment the below to add a Signed-off-by line to the message.

Doing this in a hook is a bad idea in general, but the prepare-commit-msg

hook is more suited to it.

#

SOB=\$(git var GIT_AUTHOR_IDENT | sed -n 's/^(.*>).*\$/Signed-off-by: \1/p')

grep -qs "^\$SOB" "\$1" || echo "\$SOB" >> "\$1"

This example catches duplicate Signed-off-by lines.

test "" = "\$(grep '^Signed-off-by: ' "\$1" |

sort | uniq -c | sed -e '/^[]*1[]/d')"

|| {
echo >&2 Duplicate Signed-off-by lines.

exit 1

}

C:\Users\david/src/hephaestus\.git\hooks\fsmonitor-watchman.sample

#!/usr/bin/perl

use strict;

use warnings;

use IPC::Open2;

An example hook script to integrate Watchman

(<https://facebook.github.io/watchman/>) with git to speed up detecting

new and modified files.

#

The hook is passed a version (currently 2) and last update token

formatted as a string and outputs to stdout a new update token and

all files that have been modified since the update token. Paths must

be relative to the root of the working tree and separated by a single NUL.

#

To enable this hook, rename this file to "query-watchman" and set

'git config core.fsmonitor .git/hooks/query-watchman'

#

my (\$version, \$last_update_token) = @ARGV;

Uncomment for debugging

print STDERR "\$0 \$version \$last_update_token\n";

Check the hook interface version

<<\DOC_END
```

This sample hook safeguards topic branches that have been published from being rewound.

The workflow assumed here is:

- * Once a topic branch forks from "master", "master" is never merged into it again (either directly or indirectly).
- * Once a topic branch is fully cooked and merged into "master", it is deleted. If you need to build on top of it to correct earlier mistakes, a new topic branch is created by forking at the tip of the "master". This is not strictly necessary, but it makes it easier to keep your history simple.
- * Whenever you need to test or publish your changes to topic

branches, merge them into "next" branch.

The script, being an example, hardcodes the publish branch name to be "next", but it is trivial to make it configurable via \$GIT_DIR/config mechanism.

With this workflow, you would want to know:

(1) ... if a topic branch has ever been merged to "next". Young topic branches can have stupid mistakes you would rather clean up before publishing, and things that have not been merged into other branches can be easily rebased without affecting other people. But once it is published, you would not want to rewind it.

(2) ... if a topic branch has been fully merged to "master".

Then you can delete it. More importantly, you should not build on top of it -- other people may already want to change things related to the topic as patches against your "master", so if you need further changes, it is better to fork the topic (perhaps with the same name) afresh from the tip of "master".

Let's look at this example:

o---o---o---o---o---o---o---o---o "next"
/ / / /

```

/ a---a---b A  /      /
/ /           /      /
/ / c---c---c---c B      /
/ / /         \      /
/ / / b---b C   \      /
/ / / /         \      /
---o---o---o---o---o---o---o---o---o---o "master"

```

A, B and C are topic branches.

- * A has one fix since it was merged up to "next".
- * B has finished. It has been fully merged up to "master" and "next", and is ready to be deleted.
- * C has not merged to "next" at all.

We would want to allow C to be rebased, refuse A, and encourage B to be deleted.

To compute (1):

```

git rev-list ^master ^topic next
git rev-list ^master      next

```

if these match, topic has not merged in next at all.

To compute (2):

```
git rev-list master..topic
```

if this is empty, it is fully merged to "master".

An example hook script to prepare the commit log message.

Called by "git commit" with the name of the file that has the

commit message, followed by the description of the commit

message file. If the hook fails with a non-zero status,

the commit is aborted.

To enable this hook, rename this file to "prepare-commit-msg".

This hook includes three examples. The first one removes the

"# Please enter the commit message..." help message.

#

The second includes the output of "git diff --name-status -r"

into the message, just before the "git status" output. It is

commented because it doesn't cope with --amend or with squashed

commits.

The third example adds a Signed-off-by line to the message, that can

still be edited. This is rarely a good idea.

C:\Users\david/src\hephaestus\.git\hooks\push-to-checkout.sample

#!/bin/sh

An example hook script to update a checked-out tree on a git push.

#

This hook is invoked by git-receive-pack(1) when it reacts to git

push and updates reference(s) in its repository, and when the push

tries to update the branch that is currently checked out and the

receive.denyCurrentBranch configuration variable is set to

updateInstead.

#

By default, such a push is refused if the working tree and the index

of the remote repository has any difference from the currently

checked out commit; when both the working tree and the index match

the current commit, they are updated to match the newly pushed tip

of the branch. This hook is to be used to override the default

behaviour; however the code below reimplements the default behaviour

as a starting point for convenient modification.

#

The hook receives the commit with which the tip of the current

branch is going to be updated:

commit=\$1

It can exit with a non-zero status to refuse the push (when it does

so, it must not modify the index or the working tree).

die () {

echo >&2 "\$@"

```
exit 1
```

```
}
```

```
# Or it can make any necessary changes to the working tree and to the

```
# index to bring them to the desired state when the tip of the current

```

```
#
```

```
# For example, the hook can simply run git read-tree -u -m HEAD "$1"
```

```
# in order to emulate git fetch that is run in the reverse direction
```

```
# with git push, as the two-tree form of git read-tree -u -m is
```

```
# essentially the same as git switch or git checkout that switches
```

```

```

```
# not interfere with the difference between the branches.

Provisioning & Setup

This describes how to setup the development environment

macOS / iOS

This assumes you have Homebrew installed. If not, install it via:

```
`/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"`
```

You will need Xcode. Install it from the app store if you don't have it already.

You will also need to install the Xcode Command Line Tools. Open Xcode, then choose Settings... (or File > Settings...)

To install a simulator, open Xcode > Settings... (or Preferences...) and select the Platforms (or Components) tab
