Signed-off-by: David Piper <david.piper@mailfence.com>

# Helpful information:

# - Messages should follow conventional commit style

# - Possible message types: build, ci, chore, docs, feat, fix,

# perf, refactor, revert, style, test

# - Header:

# - format: [type]: [short subject]

# - should be less than 72 chars, ideally less than 50

# - Body:

# - each line should also be less than 72 characters

C:\Users\david\src\dotfiles\README.md

## # dotfiles

My dotfiles for Linux OS installs.

Mainly used as a backup in case the Windows Linux Subsystem bugs out any more, as I have lost several installs of Ubuntu to its problems and do not wish to have this happen anymore.

## ## Usage

Create a symbolic link from this repository to wherever you want the files and directories to be used from i.e. `~`.

To create such a symbolic link run the command `ln -s SRC DEST` replacing SRC with the src file and DEST with the destination file.

For example the following command makes a symbolic link from my dotfiles theme directory for my custom zsh theme to my oh-my-zsh theme directory.

## ### Windows

Run `python .\setup\_links\_windows.py` on Windows from an admin terminal to setup the PowerShell config links.

```zsh

ln -s \

~/David/usr/src/dotfiles/zsh-themes/david-piper.zsh-theme \

~/.oh-my-zsh/themes/david-piper.zsh-theme

...

Note I am using WSL for my Linux environment and thus have a Symbolic Link from my WSL user directory to my Windows user directory, which is the `David` directory/symbolic link referred to above.

## ZSH

### Oh My ZSH! Plugins

- zsh-nvm (TODO: install and configure nvm)

## Things to Do To Get Going on a New OS

1. Install ZSH and change the default shell to it.
2. Install Neovim.
3. Install pyenv

### Automatic Installation

1. Run `./setup-links.sh`
2. Open a file with Neovim and run `:PlugInstall`

### Manual Installation

1. Install Oh My ZSH.

2. Make symbolic links for Neovim init.vim and for .zshrc.

3. Install Vim Plug plugin manager for Neovim

```zsh

```
sh -c 'curl -fLo "${XDG_DATA_HOME:-$HOME/.local/share}"/nvim/site/autoload/plug.vim --create-dirs \
      https://raw.githubusercontent.com/junegunn/vim-plug/master/plug.vim'
```

```

4. Make sym link for my zsh-theme.

```zsh

```
ln -s \
```

```
~/src/dotfiles/zsh-themes/david-piper.zsh-theme \
```

```
~/oh-my-zsh/themes/david-piper.zsh-theme
```

```

5. Install [Base16 Shell](<https://github.com/base16-project/base16-shell>).

6. Set shell theme (either `set-day-theme` or `set-night-theme`)

```
C:\Users\david\src\dotfiles\setup-links.sh
```

```
#!/bin/zsh
```

```
# This script is intended to be run after you have installed ZSH, Neovim,
```

```
# pyenv, with your operating system's package manager.
```

```
# Install Oh My ZSH
```

```
sh -c "$(curl -fsSL https://raw.githubusercontent.com/ohmyzsh/ohmyzsh/master/tools/install.sh)"
```

```
# Setup my Oh My ZSH theme
```

```
ln -sf \
```

```
~/src/dotfiles/zsh-themes/david-piper.zsh-theme \
```

```
~/.oh-my-zsh/themes/david-piper.zsh-theme
```

```
# Setup my Neovim config file
```

```
if [ ! -d ~/.config/nvim ]; then
```

```
    mkdir ~/.config/nvim
```

```
fi
```

```
ln -sf \
```

```
~/src/dotfiles/init.vim \
```

```
~/.config/nvim/init.vim
```

```
ln -sf \
```

```
~/src/dotfiles/.zshrc \
```

```
~/.zshrc
```

```
# Install the Plug Manager for Neovim
```

```
sh -c 'curl -fLo "${XDG_DATA_HOME:-$HOME/.local/share}"/nvim/site/autoload/plug.vim --create-dirs \
```

```
https://raw.githubusercontent.com/junegunn/vim-plug/master/plug.vim'
```

```
# Install base16-shell
```

```
git clone https://github.com/tinted-theming/base16-shell.git \
```

```
$HOME/.config/base16-shell
```

```
# Install base16-shell Oh My ZSH plugin
```

```
mkdir $HOME/.oh-my-zsh/plugins/base16-shell
```

```
ln -s $HOME/.config/base16-shell/base16-shell.plugin.zsh \
```

```
$HOME/.oh-my-zsh/plugins/base16-shell/base16-shell.plugin.zsh
```

```

<<\DOC\_END

This sample hook safeguards topic branches that have been published from being rewound.

The workflow assumed here is:

- \* Once a topic branch forks from "master", "master" is never merged into it again (either directly or indirectly).
  
- \* Once a topic branch is fully cooked and merged into "master", it is deleted. If you need to build on top of it to correct earlier mistakes, a new topic branch is created by forking at the tip of the "master". This is not strictly necessary, but it makes it easier to keep your history simple.
  
- \* Whenever you need to test or publish your changes to topic

branches, merge them into "next" branch.

The script, being an example, hardcodes the publish branch name to be "next", but it is trivial to make it configurable via \$GIT\_DIR/config mechanism.

With this workflow, you would want to know:

(1) ... if a topic branch has ever been merged to "next". Young topic branches can have stupid mistakes you would rather clean up before publishing, and things that have not been merged into other branches can be easily rebased without affecting other people. But once it is published, you would not want to rewind it.

(2) ... if a topic branch has been fully merged to "master".

Then you can delete it. More importantly, you should not build on top of it -- other people may already want to change things related to the topic as patches against your "master", so if you need further changes, it is better to fork the topic (perhaps with the same name) afresh from the tip of "master".

Let's look at this example:

```
o---o---o---o---o---o---o---o "next"
/     /      /      /
```

```
/ a---a---b A / /  
/ / / / /  
/ / c---c---c---c B /  
/ / / \ /  
/ / / b---b C \ /  
/ / / / \ /  
---o---o---o---o---o---o---o---o---o "master"
```

A, B and C are topic branches.

\* A has one fix since it was merged up to "next".

\* B has finished. It has been fully merged up to "master" and "next",  
and is ready to be deleted.

\* C has not merged to "next" at all.

We would want to allow C to be rebased, refuse A, and encourage  
B to be deleted.

To compute (1):

```
git rev-list ^master ^topic next  
git rev-list ^master      next
```

if these match, topic has not merged in next at all.

To compute (2):

```
git rev-list master..topic
```

if this is empty, it is fully merged to "master".

```
C:\Users\david\src\dotfiles\.git\hooks\push-to-checkout.sample
```

```
#!/bin/sh
```

```
# An example hook script to update a checked-out tree on a git push.
```

```
#
```

```
# This hook is invoked by git-receive-pack(1) when it reacts to git
```

```
# push and updates reference(s) in its repository, and when the push
```

```
# tries to update the branch that is currently checked out and the
```

```
# receive.denyCurrentBranch configuration variable is set to
```

```
# updateInstead.
```

```
#
```

```
# By default, such a push is refused if the working tree and the index
```

```
# of the remote repository has any difference from the currently
```

```
# checked out commit; when both the working tree and the index match
```

```
# the current commit, they are updated to match the newly pushed tip
```

```
# of the branch. This hook is to be used to override the default
```

```
# behaviour; however the code below reimplements the default behaviour
```

```
# as a starting point for convenient modification.
```

```
#
```

```
# The hook receives the commit with which the tip of the current
```

```
# branch is going to be updated:
```

```
commit=$1
```

```
# It can exit with a non-zero status to refuse the push (when it does
```

```
# so, it must not modify the index or the working tree).
```

```
die () {
```

```
echo >&2 "$*"
```

```
exit 1
}

# Or it can make any necessary changes to the working tree and to the
# index to bring them to the desired state when the tip of the current
# branch is updated to the new commit, and exit with a zero status.

#
# For example, the hook can simply run git read-tree -u -m HEAD "$1"
# in order to emulate git fetch that is run in the reverse direction
# with git push, as the two-tree form of git read-tree -u -m is
# essentially the same as git switch or git checkout that switches
# branches while keeping the local changes in the working tree that do
# not interfere with the difference between the branches.

# The below is a more-or-less exact translation to shell of the C code
# for the default behaviour for git's push-to-checkout hook defined in
# the push_to_deploy() function in builtin/receive-pack.c.

#
# Note that the hook will be executed from the repository directory,
# not from the working tree, so if you want to perform operations on
# the working tree, you will have to adapt your code accordingly, e.g.
# by adding "cd .." or using relative paths.

if ! git update-index -q --ignore-submodules --refresh
then
    die "Up-to-date check failed"
fi
```

```
if ! git diff-files --quiet --ignore-submodules --

C:\Users\david\src\dotfiles\old\README.md

# dotfiles #

The purpose of this directory is to automate and backup settings from Unix-like OSs (dotfiles)

\* [Install](#install)

\* [Options](#options)

<a name="install"/>

# Install #

---

git clone https://github.com/Suerg/dotfiles.git

cd dotfiles

./init.sh -all

---

<a name="options"/>

# Options #

<!--

-TODO: man page

-->

---

init.sh -all

---

Initializes: sym-links, vim, and bash.

---

init.sh -vim

...

Downloads and installs all vim plugins. This will remove and reinstall any from the list that are already present.

...

init.sh -bash

...

Installs bash-it if not already installed.

...

init.sh -lns

...

Initializes sym-links from git directory to user's home.

# These are the compilation flags that will be used in case there's no
# compilation database set (by default, one is not set).

# CHANGE THIS LIST OF FLAGS. YES, THIS IS THE DROID YOU HAVE BEEN LOOKING FOR.

flags = [
    '-Wall',
    '-Wextra',
    '-Werror',
    # '-Wc++98-compat', using c++14
    '-Wno-long-long',
    '-Wno-variadic-macros',
    '-fexceptions',
    '-DNDEBUG',
    # You 100% do NOT need -DUSE_CLANG_COMPLETER in your flags; only the YCM
    # source code needs it.
    '-DUSE_CLANG_COMPLETER',
    # THIS IS IMPORTANT! Without a "-std=<something>" flag, clang won't know which
    # language to use when compiling headers. So it will guess. Badly. So C++
    # headers will be compiled as C headers. You don't want that so ALWAYS specify
    # a "-std=<something>".
    # For a C project, you would set this to something like 'c99' instead of
```

```
# 'c++11'.
'-std=c++14',
# ...and the same thing goes for the magic -x option which specifies the
# language that the files to be compiled are written in. This is mostly
# relevant for c++ headers.

# For a C project, you would set this to 'c' instead of 'c++'.

'-x',
'c++',
'-isystem',
'../BoostParts',
'-isystem',
# This path will only work on OS X, but extra paths that don't exist are not
# harmful
'/System/Library/Frameworks/Python.framework/Headers',

]

# Set this to the absolute path to the folder (NOT the file!) containing the
# compile_commands.json file to use that instead of 'flags'. See here for
# more details: http://clang.llvm.org/docs/JSONCompilationDatabase.html
#
# You can get CMake to generate this file for you by adding:
# set( CMAKE_EXPORT_COMPILE_COMMANDS 1 )
# to your CMakeLists.txt file.
#
# Most projects will NOT need to set this to anything; you can just change the
# 'flags' list of compilation flags. Notice that YCM itself uses that approach.
